... Mathematizing Story Maps ...

How do your students approach word problems?

Key words don't always help. What are we supposed to underline in **CUBES** anyway?

Sometimes it feels like students just pick an operation and they don't know why!

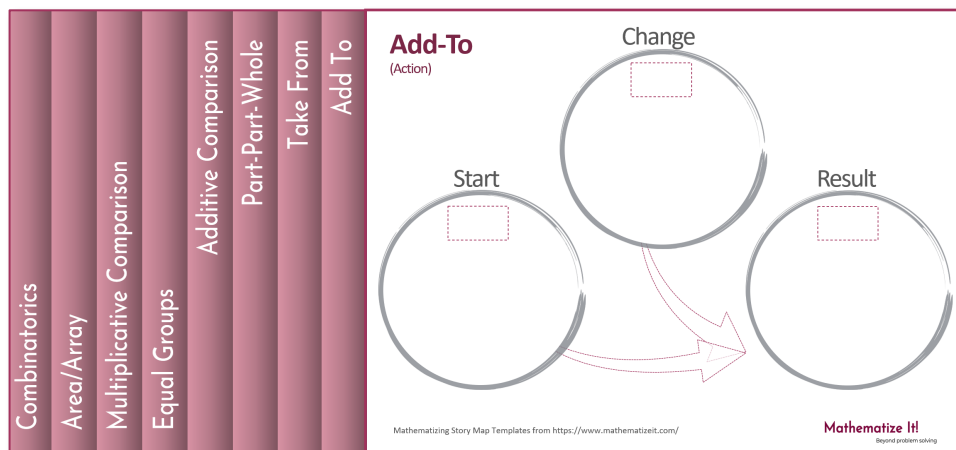

These strategies don't prepare students to formulate and solve **problems that matter** to them.

...
Prepare students to DO math!
...

Teacher Background

Mathematizing Story Maps encourage students to **model** with mathematics and find the math in their everyday lives. Opening stories are written to engage students first in thinking about the **story** and then about the mathematics.

Mathematizing Story Maps help students understand what the four familiar operations (+ - × ÷) can do. The more students know about how we use subtraction or when we use division, the more skills they will have to match a strategy to a problem.

Mathematize It!

Beyond problem solving

How to teach the Mathematizing Story Maps

1. **Read the story**
 - a. Think about how your students might respond. What's familiar? What's not?
 - b. What mathematics is seen in the story? How might students **represent their thinking**?
2. **Choose tools you have and that students know.**
 - a. What **manipulatives** might your students use to represent the mathematics in the story? Consider counters, base ten materials, fraction tools, or more!
 - b. What **visual representations** might your students know (ten frames, number tracks, number lines, grid paper, etc.)
3. **Choose a Mathematizing Story Map**

We share a mathematizing story map for each of 8 categories of problem situations.

Mathematizing Story Maps help students act out or represent what is happening in a problem and make sense of it.

What will students do?

Most word problems (story problems) students encounter support their calculation skills. We need to build their understanding of **how to use math** to solve real problems.

- Find the story behind every mathematical problem situation
- Use one of 8 Mathematizing Story Maps to act it out or show
- Represent the story and choose an operation (+ – × ÷) that matches the story.
- **Resist answer-getting.** We pay attention to the process of solving problems

What's included?

Each mathematizing story map lesson includes:

- Teaching notes on 8 categories of problem situations.
- Teaching notes for the Mathematizing Story Maps
- A set of questions to pose that focus students on the mathematizing story.

To read more about problem situations and the four operations, check out the [Mathematize It!](#) book series.

Teacher Notes

Mathematizing Story Maps

When Little Sisters Count

Problem Type

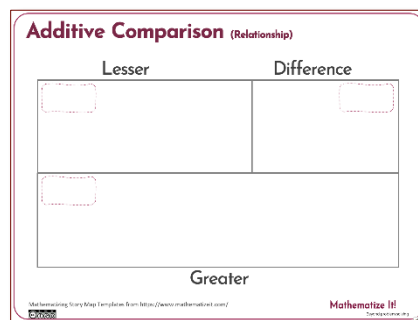

This story supports developing mathematical ideas around the Additive Comparison job of addition. These problem situations describe two quantities with a constant difference. There is no action in these problems; rather, the relationship between the two quantities, one with a greater value and one with a lesser value is important. Students can represent the two quantities and the difference between them on the Mathematizing Story Map.

Missing Element

In this story, the greater quantity is unknown. Students know the lesser quantity as well as the difference between the two quantities being compared. They are challenged to find the greater quantity.

The Mathematizing Story Map

The Mathematical Story Map provided supports the Additive Comparison job of addition by showing the lesser quantity and the difference on the upper row of the bar model and using the longer lower bar to show the greater quantity.

Action Situations	Add To	Result Unknown	Change Unknown	Start Unknown
	Take From	Result Unknown	Change Unknown	Start Unknown
Relationship Situations	Part-Part Whole	Total Unknown	One Part Unknown	Both Parts Unknown
	Additive Comparison	Difference Unknown	Greater Quantity Unknown	Lesser Quantity Unknown

Mathematize It!

Beyond problem solving

Day 1

Read the story at least once with your class. Talk about the story and support your students as they make sense of the events in the story as you would for any narrative.

You may wish to use the [Three Reads Strategy](#) (p.15) to support student understanding of the text itself.

Then encourage students to find the mathematics in the story with questions like these:

- *What quantities are being compared? How do you know?*
- *What quantity is greater? Which is lesser?*
- *What are you trying to figure out in this problem?*

If students start calculating numbers right away, particularly if they are “number-plucking” or randomly doing calculations, refocus their attention on the relationship in the story.

To focus on the story, create a [numberless word problem](#). Remove the numbers from the story as the class discusses it.

Encourage students to use manipulatives as they work on the Mathematizing Story Map to show the relationship that is in the story. Label the quantities and their units. Before ending for the day, give students the opportunity to record their thinking on paper.

Encourage students to use manipulatives and visuals to show their thinking about the math in the story. Students should translate their work from manipulatives and sketches to the mathematical story map.

Day 2

Reread the story and use the Mathematizing Story Map to retell it and act it out. Ask your students to translate their actions on the Mathematizing Story Map into an equation. Each student should be able to connect the elements of the story map to the narrative. Discuss the **quantities** in the story and what strategies students might use to find an answer to the question they have asked. Ask students to consider other mathematical stories (or variations on the current story) they can see in this narrative.

Additive Comparison (Relationship)	
Lesser	Difference
15 Alisa 	5 
? Limar	
Greater	

How many crackers?

Additive Comparison (Relationship)	
Lesser	Difference
15 Alisa 	5 
? Limar	
$15 + 5 = 20$ crackers	
Greater	

How many crackers?

Day 3

Use the mathematizing story map to support solving the word problems provided. Take time for reading comprehension (does the story make sense?) before mathematical comprehension (what is happening in the story?) These questions can help students develop mathematical comprehension.

- *What quantities are being compared? How do you know?*
- *What quantity is greater? Which is lesser?*
- *What are you trying to figure out in this problem?*

Encourage your students to use manipulatives and visuals to show their thinking about the math happening in each problem. Students should translate their work from manipulatives and sketches to the mathematical story map.

Days 4-5

Choose one or more of these options to continue developing student thinking.

- Continue working on the problems provided, focusing on the story map as a tool to develop mathematical comprehension and operation sense.
- Lead a discussion among students focusing on how the story map fits the narrative and problems provided. Use these questions to focus thinking on the job Additive Comparison is doing in these situations:
 - *What quantities are being compared? How do you know?*
 - *Where does the difference between the quantities appear on the Mathematizing Story Map? Where are the quantities being compared represented?*
 - *How does the language in the problem help you know to compare quantities?*
 - *What number sentence(s) can you write to show these relationships?*
- Ask students to develop new narratives or problems, either from scratch or as extensions of the current storyline, which can also be told using the same mathematical story map. Encourage students to explain the underlying connections which make the mathematics similar even if the story contexts are not the same.

Beyond problem solving

When Little Sisters Count Practice Problems

Use objects, pictures, numbers, and words to describe what is happening in each problem. Use a mathematizing story map to record your thinking.

Limar and Alisa have been working to earn money to buy toys to send to their cousins. Limar has earned \$7, \$3 less than Alisa. How much has Alisa earned so far?

Ninong Troy is planning the garden for next summer. He wants to plant 10 tomato plants. Peppers can be planted closer together so that row will have 4 more plants than the row of tomato plants. How many peppers will Ninong Troy plant?

Limar is helping Ninang Janet wrap presents for the holidays. Limar has wrapped 5 gifts and Ninang Janet has wrapped 1 more than Limar. How many gifts has Ninang Janet wrapped?
